# Solving Poor Infrastructure in Kenya Using Robert Fritz's Method

Poor infrastructure is a major problem in Kenya. Many roads have potholes, some areas struggle to access clean water, electricity is often unstable, and public transport can be slow and unreliable. To understand and solve this issue, we can apply Robert Fritz's creative thinking method, which focuses on knowing the current situation, imagining a better future, and taking steps that bridge the gap between the two.

## 1. Current Reality

### *Understanding the Present Situation*

Kenya's infrastructure faces several challenges. Many roads are damaged, water systems break down often, and electricity supply is inconsistent. Public transport is also slow and overcrowded in some areas. In addition to this, corruption, weak planning, and poor management make the situation even worse. Knowing the honest reality helps us see where the country currently stands.

## 2. Desired Future

### *Imagining What Kenya Should Look Like*

The desired future is a Kenya with smooth and durable roads, clean and reliable water systems, stable electricity, and modern transport services. A country where infrastructure supports growth instead of slowing it down. Having this clear vision is important because it guides the direction of change.

---

## 3. Structural Tension

### *The Gap Between the Present and the Future*

Robert Fritz explains that progress is created by "structural tension." This tension comes from comparing the current situation with the future we want. When we clearly see the difference between poor roads and the dream of smooth highways, or between unreliable electricity and the hope for stable power, it motivates us to think and act. This tension pushes us to find solutions that can close the gap.

## 4. Actions

### *Steps Kenya Can Take to Move Forward*

To move from the current reality to the desired future, Kenya can take several actions:

- Improve planning and use public funds wisely
- Use technology to reduce corruption
- Work with private companies to support development
- Train workers such as engineers and project managers
- Involve communities in maintaining projects
- Repair and protect existing infrastructure, not only build new ones

These actions help reduce the gap between what Kenya has now and what it aims to achieve.

## Conclusion

By understanding the current reality, imagining a better future, and taking steps that bring the two closer, Kenya can improve its infrastructure. Robert Fritz's method makes the problem easier to approach because it breaks change into simple, realistic steps. With the right actions and commitment, Kenya can create stronger, modern, and reliable infrastructure for its people.
